LIMITS: INFO SHEETS1

Definitions

- Equals is designated with an equals sign =.
- **Approaching** is designated with an arrow →.
- A **finite number** is any real number in the set $(-\infty, \infty)$. Note: ∞ 's are not included.
 - o Examples of finite numbers include any of the following familiar constants and much much more!

0, 1,2, -\frac{1}{3}, 365, 86, -89987665433222,
$$ln(2)$$
, $-6log_7(2)$, π , e , $\sqrt{\pi}$, e^{-8} , etc. etc.

- Infinity is not a real number! It's something you approach but never "get to".
- A finite nonzero number is any real number in the set $(-\infty, 0) \cup (0, \infty)$. Note: zero and ∞ 's are not included.
- An an indeterminate form (or an undefined quantity) is nonsense, it gives NO INFORMATION about the value of the limit.
 - \circ Examples of undefined quantities: $\frac{\infty}{\infty}$, $\frac{0}{0}$, $\infty-\infty$, $\infty\cdot 0$, 1^{∞} , 0^{0} , ∞^{0}
 - o If you encounter an undefined quantity, you must proceed by doing valid algebra or other valid math to obtain the answer.

Don't memorize, understand!

The info sheets will help initially,

but you need to learn and understand the material WITHOUT aid of the info sheets!

LIMITS: THE BASICS

Plug x=a into numerator f(x) and denominator g(x). USE ARROWS to record the results $\lim_{x\to a} \frac{f(x)}{g(x)} \xrightarrow{\to A} B$.

- **A,B** are both finite nonzero: $\lim_{x\to a} \frac{f(x)}{g(x)} = \frac{A}{B}$
- **❖** A is finite nonzero and ...

$$ightharpoonup \dots$$
 B is infinite: $\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to A} \infty \to 0$ $ightharpoonup \dots$ B is zero: $\left(\begin{array}{c} \to A \\ \to 0 \end{array} \to \infty \right)$

$$ightharpoonup \dots$$
 B is zero: $\left(\begin{array}{c} \frac{\rightarrow A}{\rightarrow 0} \rightarrow \infty \right)$

	A positive	A negative
$B \rightarrow 0^+$	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\rightarrow A^{(+)}} \to +\infty$	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to A^{(-)}} \to -\infty$
B → 0 ⁻	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to A^{(+)}} \to -\infty$	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to A^{(-)}} \to +\infty$

B is finite nonzero and ...

> ... A is zero:
$$\lim_{x\to a} \frac{f(x)}{g(x)} = \frac{0}{B} = 0$$

$$ightharpoonup \dots$$
 A is infinite: $\left(\frac{\to \infty}{\to B} \to \infty \right)$ $\mbox{$\mbox$

	$A o + \infty$	$A \rightarrow -\infty$
B positive	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to +\infty} \to +\infty$	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to -\infty} -\infty$
B negative	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to +\infty} -\infty$	$\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to -\infty} \to +\infty$

These cases require an extra step. Mentally test out x-values **VERY VERY** (infinitesimally) close to x=a, to see whether A is positive or negative in the numerator, and to see whether denominator approaches zero with positive or negative numbers. Use your results to add in superscripts indicating your results, then conclude plus/minus infinity according to the charts.

LIMITS: DEALING WITH ZEROS & INFINITIES TOGETHER²

Plug x=a into numerator f(x) and denominator g(x). USE ARROWS to record the results $\lim_{x\to a} \frac{f(x)}{g(x)} \xrightarrow{\to A} B$.

- ***** A,B are both zero or both infinity: $\lim_{x\to a} \frac{f(x)}{g(x)} \xrightarrow{\to 0}$ OR $\lim_{x\to a} \frac{f(x)}{g(x)} \xrightarrow{\to \infty}$
 - > Basic Strategy:
 - Use algebra to simplify your quantity $\frac{f(x)}{g(x)}$.
 - Foil, factor, or multiply by the conjugate -- as is appropriate for your problem.
 - Cancel, simplify, reduce, until eventually the limit evaluates to something ON THE PREVIOUS PAGE.
 - > Advanced Strategy:
 - Use L'Hopital's Rule: $\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} \frac{f'(x)}{g'(x)}$
 - Apply L'Hopital's rule mindfully: watch out for basic algebra, simplifications, reductions.
 - After L'Hopital & simplifying, eventually the limit will evaluate to something ON THE PREVIOUS PAGE.
- One of A,B is zero and the other is infinity: $\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to \infty}$ OR $\lim_{x \to a} \frac{f(x)}{g(x)} \xrightarrow{\to \infty}$
 - ightharpoonup Rewrite $\frac{f(x)}{g(x)} = f(x) \cdot \frac{1}{g(x)}$ and then use limit laws.
 - If A is zero, and B is infinity then you will get...

$$\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} f(x) \cdot \frac{1}{g(x)} = \lim_{x \to a} f(x) \cdot \lim_{x \to a} \frac{1}{g(x)} = 0 \cdot \left(\frac{\to 1}{\to \infty}\right) \to 0 \cdot 0 \to 0.$$

■ If A is infinity, and B is zero then you will GENERALLY get...

$$\lim_{x \to a} \frac{f(x)}{g(x)} = \lim_{x \to a} f(x) \cdot \frac{1}{g(x)} = \lim_{x \to a} f(x) \cdot \lim_{x \to a} \frac{1}{g(x)} = \infty \cdot \left(\frac{\to 1}{\to 0}\right) \to \infty \cdot \infty \to \infty.$$

 $\red{1}$ Decide whether the answer is $+\infty$ or $-\infty$ by testing out x-values infinitesimally close to x=a.

Can you create a chart of the possibilities? Hint:
$$+\infty \cdot \left(\frac{-1}{-0}\right) \to +\infty \cdot (-\infty) \to -\infty$$

ADVANCED TOPIC: ZEROS TIMES INFINITY³

- Suppose you had a product limit $\lim_{x\to a} f(x) \cdot g(x)$ where $f(x)\to 0$ and $g(x)\to \infty$. Now pick whichever option is easier:
 - > Option #1: Rewrite $f(x) \cdot g(x) = \frac{f(x)}{\left(\frac{1}{g(x)}\right)}$, then you will get ...

$$\lim_{x \to a} f(x) \cdot g(x) = \lim_{x \to a} \frac{f(x)}{\left(\frac{1}{g(x)}\right)} \to \frac{\to 0}{\left(\frac{1}{\to \infty}\right)} \to \frac{\to 0}{\to 0} \quad \text{NOW APPLY L'HOPITAL' RULE, see previous page}$$

> Option #2: Rewrite $f(x) \cdot g(x) = \frac{g(x)}{\left(\frac{1}{f(x)}\right)}$, then you will get ...

$$\lim_{x \to a} f(x) \cdot g(x) = \lim_{x \to a} \frac{g(x)}{\left(\frac{1}{f(x)}\right)} \to \frac{-\infty}{\left(\frac{1}{-0}\right)} \to \frac{-\infty}{-\infty} \quad \text{NOW APPLY L'HOPITAL' RULE, see previous page}$$

> Having the foresight to determine whether Option #1 or Option #2 is better requires skill.

Practice, practice, in order to get the skills necessary to make the right choices!

ADVANCED TOPIC: 1^{∞} , 0^{0} , ∞^{0}

 \bullet Suppose you had a power limit $\lim_{x\to a} f(x)^{g(x)}$ where $f(x)\to 1$ and $g(x)\to \infty$; this gives the indeterminate form 1^∞ .

Other combinations for the f(x), g(x) limits give the other cases, but they all require the same strategy:

- > Start by writing $y = f(x)^{g(x)}$.
- ightharpoonup Take the In of both sides, and use log algebra rules to obtain $ln(y) = g(x) \cdot ln(f(x))$.
- > Now take the desired limit on both sides. It will REDUCE TO SOMETHING ABOVE!
- > Don't forget to exponentiate your answer (to undo the In).
